

Test Cases and Intentions

Test Name	Functionality Category (Account / Buying / Cart)	Intention of Test
login-required-before-transaction	Account	Verifies transactions are only accepted after the user is logged in.
logout-requires-login	Account	Verifies a logout can only be initiated if the user is currently logged in.
login-blocked-if-logged-in	Account	A user who wants to login is rejected if they already have an active login session.
create-admin-only	Account	Ensures only admin can create accounts with the create function, and checks the privileges of the “create” function, ensuring starting credit is 0. Correct inputs should create a 01 log, else part of the test will ensure not having privileges should not produce an 01 log.
create-username-length	Account	Checks the character length limit of 15 characters for usernames exists.
create-username-unique	Account	Verifies that a username already part of an account is not able to be used again for a username in a new account.
delete-admin-only	Account	Attempt to use the “delete” user function, and ensure only admin privileged users can use it.
delete-target-check	Account	Ensures delete requires an existing user by attempting to delete a fresh account with a resulting 02 log (once without the account specified to ensure no 02 code).
delete-current-admin	Account	The admin who is currently logged in can delete their own account and produce an 02 log. The session will then end.
admin-add-credit	Account	Check that when the user has admin

		privileges, they must have an existing and valid user selected to add credits to. The “addcredit” runs, and an 06 log is created.
add-credit-limit	Account	Verifies the \$1000.00 limit for an active session is held in place for a normal user, as soon as one cent over that limit in a session the credit addition is rejected.
credit-overflow	Account	The “addcredit” function should not take in a credit value over 999999.99, and including the decimal “.”, credit should always remain within a 9 character length, producing a 06 log.
bad-number-field	Account	The front end of the software system should be able to notify the user if an inputted field value from the user is not valid (applies to “create” and “addcredit” input fields).
login-user-validation	Account	Existing login information for a user should succeed, whereas nonexistent should be rejected.
create-and-type	Account	An admin using “create” should have an account recorded as “AA”, “FS”, “BS”, or “SS”, rejecting any other type. Initial user credit is enterable, and should be logged in a 01 log, with no 06 log made.
add-credit	Account	“addcredit” as “FS”, “BS”, or “SS” should require credit amount and produce 06 log when successful.
invalid-input	Account	Unknown commands coming from a front end operation should have the system operating smoothly with a notification that the command is not recognized, and return the screen to its state prior to the screen the user sees an error.
file-reading	Account	Frontend marketplace should correctly process collection, account, and available game info, interpreting padding, and “END” markers. Collections should have owners

		highlighted, with terminators not appearing.
session-end	Account	After a normal transaction and a user logs out at the end of a session, transactions should appear followed by a 00 log, with no rejected transactions present. Read and correctly parse fields in 01, 02, and 06 logs, ensuring a session with a successful transaction has more than just a 00 log.
seller-not-overflow	Buying	Checks that a seller's balance will not exceed 999,999.99 if a buyer is initiating a transaction with a seller's game, with no 04 record produced.
admin-only-refund	Buying	Verifies only a user with admin privileges can initiate a refund.
admin-refund-users	Buying	Checks that the refund contains one buyer and one seller who are both current users.
admin-refund-credits	Buying	Checks that the credit amount is deducted from the seller, and added to the buyer's credit.
admin-refund-rebought	Buying	Checks a refunded game can be selected, and have a transaction initiated by a user with buying privileges, outputting an 04 log.
buyable-games	Buying	Verifies that the transaction list outputted to the terminal containing all currently available software matches listed games on the frontend.
buy-update	Buying	Ensures buying a game updates buyer and seller credits, with a 04 log created.
buy-invalid-user	Buying	If a buyer or seller is nonexistent in a transaction, no credit changes should be made and no 04 log should be created.
refund-overflow	Buying	A buyer who is getting a refund processed who already has max credits should have a credit increase

		rejected, and no 05 log made.
daily-format-transaction	Buying	Ensures a successful purchase 04 log can be parsed matching expected values, and that refunds produce an 05 log.
sell-account-check	Cart	Ensures that the correct user permissions are set up for different account types, only “buy-standard” accounts can’t sell.
sell-price-limit	Cart	Verifies there is a max sell price of 999.99 that can be entered in a game sale listing, reflecting the price the game can be bought for.
sell-game-name-limit	Cart	Ensures the name field of a game sale listing only accepts names with a max of 25 characters in length, producing a valid 03 log, or not if the name is invalid.
sell-game-name-unique	Cart	Verifies a game can’t be created if the name entered already exists as another game’s name.
sell-new-locked	Cart	Checks a game with a newly applied sale that starts while a buyer has an active session, and will not see the game’s sale applied in a transaction or on the platform until a new session.
deleted-user-transaction	Cart	Verifies a user that has had their account deleted, is not able to be referenced in any transactions, or the transactions will be rejected, outputting an 02 log with failed transactions not producing 04 logs.
sell-formatting	Cart	Ensures a listing creates an 03 log with parseable game information and correct padding extracted.
